

## Information on dosing system coral and sapphire

When you want to use the machine (coral or sapphire) without the use of the hydraulic circuit that permits the automatic dosing of the detergent, it is necessary, apart from putting into OFF the water pump, to bring into "d0" also the detergent dosing. If this is not done, it can happen that the detergent pump behaves in an anomalous mode letting out detergent in big quantity even if the water pump is shut.

This inconvenience is already being sorted out in the software of the check card. In the new revision of the software the maximum level flows corresponding to the 7 positions of the water pump will be updated. The new release of the software will be identified with 5\_0 and it will be in production in a few months.

Thanking you for your kind attention, we remain

with best regards
